

BLENDING BULBS

Blended Bulbs are a type of bulb that do not require a control box/choke, they consist of both a tungsten and mercury vapour filament which makes them an ideal choice if you are venturing abroad. The disadvantage with this type of bulb is they run much hotter than the conventional 125/80w MV bulb meaning any rain making contact with the bulb could cause them to explode and throw the glass. We are aware of some entomological dealers selling this type of bulb with moth traps to bring their price down and look more attractive to unsuspecting customers. We only recommend this bulb to be used with the ALS bulb guard and **NOT** used for any attended trapping such as public events.

The ALS bulb guard. Made with fine metal gauze and clear perspex top.
