moth traps and
related equipment**

The AJ06a zoom stereo is our new stereomicroscope. This is a stereomicroscope that benefits from the latest in design technology.

AJ06a Stereohead Specification

The AJ06a is a full zoom trinocular stereohead with a magnification range of x7.5 to x45 with the x10 widefield eyepieces. The range may be extended to include x3.5 to x180 with additional objectives and eyepieces. The zoom mechanism is operated by side arm control knobs. The eyetubes have full interpupillary and dioptic adjustment and eyecups are supplied as standard. The unique features of this stereohead are the fact that the trinocular tube shares the images with the binocular eyetubes which allows the microscope to be used at the same time as the image can be viewed on a monitor or PC by others. Providing the correct adapter is used the two images are parfocal which makes the AJ06a an ideal stereomicroscope for teaching and demonstration. In addition the zoom mechanism has a lock control so that a predefined magnification can be set. This is particularly useful in an industrial environment where the instrument may be used by several operators. Camera attachments also available

A rheostat controlled LED incident and transmitted light source base. Both light systems can be used together or independently and have separate brightness controls. The stand has a pole mechanism for coarse focus and a focus block with a rack and pinion mechanism. The platform has stage clips and black/white and frosted glass dissection plates.
